NINA API Reference

Authentication

Every request must carry the X-Api-Key header.
Keys are shown once at creation and stored only as a hash.
Rotating a key invalidates the previous value immediately.

Rate Limits

The default quota is one thousand requests per hour.
Exceeding the quota returns a 429 response with a reset time.
Burst traffic is smoothed with a token-bucket algorithm.

Errors

Errors follow the envelope error.code and error.message.
A blocked destination returns the blocked_destination code.
An empty extraction returns the extraction_empty code.
